

“ManyVids Pro” User Manual

THE FOLLOWING TERMS AND CONDITIONS APPLY:

While all attempts have been made to verify information provided, neither I, nor any ancillary party, assumes any responsibility for errors, omissions, or contradictory interpretation of the subject matter herein.

As the FTC Rules requires, we do not guarantee or imply that by using this tool, you will get rich or make money at all.

Software and associated files is distributed as is without any warranty of any kind, either express or implied.

Software and associated files is not freeware or shareware.

Selling or distribution of the code (in whole or in part) of this program without prior written consent is expressly forbidden.

Introduction

ManyVids is a software that allows you to easily create multiple text to speech videos for your keywords (it creates one video per keyword) with just some clicks.

And each keyword can be passed to the content of your video (text to speech), to make your videos look relevant to what the visitors are looking for.

Basically, you can get the job done in minutes by following some simple steps:

- Step 1: Enter your content.
- Step 2: Pick some images for your video.
- Step 3: Build your video.

It's that easy.

Important:

Make sure to install the software under your c: drive or under another Drive (for example, "c:\manyvidspro") but not under system folders (like "c:\program files\manyvidspro").

Once that the software is installed, you'll find everything under the following tabs:

Let's get started:

Step 1: Enter Your Content

Here you'll see the voices that are already installed in your computer:

Comment: These voices come installed with your operating system and they vary from one Windows version to another.

If you want to test a voice simply select it and click “Test Selected Voice”.

The screenshot shows a software interface for text-to-speech. At the top, there is a dropdown menu labeled "Select an Installed Voice From The List:" with "Microsoft Zira Desktop - English (United States)" selected. To the right of the dropdown is a button labeled "Test Selected Voice". Below the dropdown, there is a section labeled "Enter Your Content Below:" with two links: "Paste Content From Clipboard" and "Delete Content". To the right of this section is a note: "Important: Each carriage return will cause a pause." Below the links are four buttons labeled "Ad Copy 1", "Ad Copy 2", "Ad Copy 3", and "Ad Copy 4". To the right of these buttons is a link labeled "Insert #KEYWORD# Tag". Further right is a section labeled "Keywords:" with a button labeled "Manage Keywords". At the bottom, there is a large text area with the placeholder text "Enter your content here."

Comment: Some voices may not work with the system and this is ok but if none of the installed voices work, then you have a problem with the SAPI voices module (please find more help at the end of this document).

Then enter your content for the text to speech module.

You have the “Pro” version. This version allows you to enter multiple “Ad Copies” (up to four) per project. These ad copies will be randomly used for your videos (the software will randomly pick one of them for each video).

The screenshot shows four buttons labeled "Ad Copy 1", "Ad Copy 2", "Ad Copy 3", and "Ad Copy 4" arranged horizontally.

Comment: You don’t need to use the four spots if you don’t want to. Only 1 is required.

Keywords: From the “Manage Keywords” button, you can enter the keywords for your project.

The screenshot shows a dialog box titled "Keywords:". Inside the dialog, there is a list of keywords: "Fort Myers", "Oakland Park", "Jacksonville", "Palm Beach", "Kissimmee", "Orlando", and "Miami". To the right of the list is a button labeled "Manage Keywords".

The software will create 1 video per keyword that you enter. You can pass the value of the keyword that's being used to the content of your video (to the text to speech module), by placing a #KEYWORD# tag in your content.

Here's an example:

The screenshot shows a software interface with four tabs labeled "Ad Copy 1", "Ad Copy 2", "Ad Copy 3", and "Ad Copy 4". To the right of the tabs is a link that says "Insert #KEYWORD:". Below the tabs, the text for "Ad Copy 1" is displayed: "Are you looking for dentists in #KEYWORD#? Download our free app and find the best professionals in the city, read reviews, make appointments and more. It's fast, easy and free. Go to myurl.com for more details."

--- Your project needs to have at least 1 keyword and we recommend you to use no more than 15 keywords per batch ---

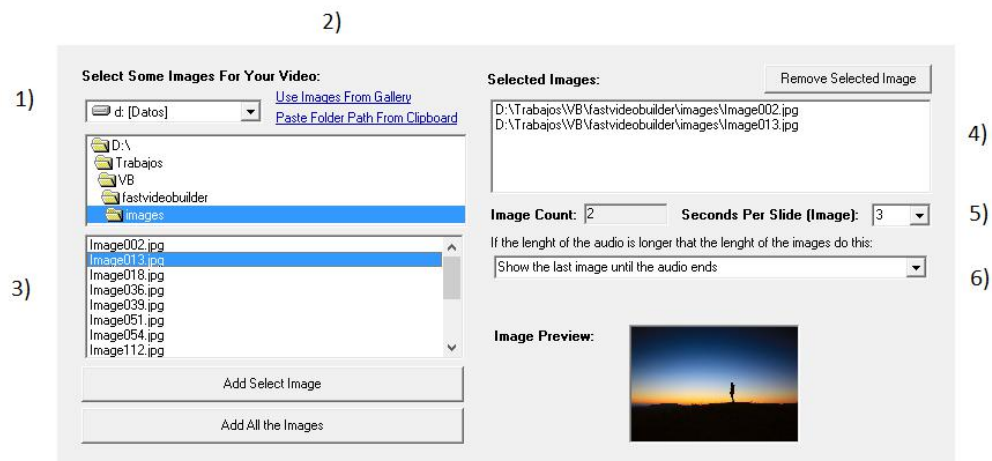

Start with a “Demo Project”: If you want to test how things work, you can use click the following button...

Step 2: Add Some Images.

Now we'll go to the “Images” tab.

From here you can select some images (slides) for your video.

References:

1) Select a Folder with Images: Select a drive and a folder (from your drive) with images.

2) Here you'll find 2 links...

"Use Images From Gallery": This will load a folder with some built-in images that you can use to quickly create your first project.

"Paste Folder Path From Clipboard": This will let you quickly load a folder from the clipboard. To use this option first copy the path of any folder to the clipboard and then click this link.

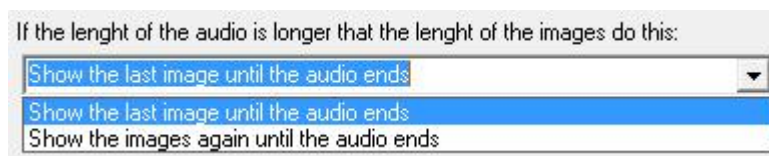

3) Select the images that you want to add to your video (you can do this in many ways: with a double click of the mouse etc).

4) Here you can see the selected images. If you want to remove an image, just select it first (make a click on it) and click "Remove Selected Image".

5) Seconds Per Slide: From here you can control the number of seconds that an image is visible before it goes to the next one.

6) From here you can control what do you want to do if the lenght of your audio... is longer than the lenght of your slides.

You have 2 options:

Option 1: Show the last image until the video ends.

Option 2: Show the images again until the video ends.

Pro: with the "Pro" version you can apply random transitions to each slide (this will make your videos look better). To enable this option, just select the following option:

☒ Apply Random Transitions to Each Slide

New: The following option will randomize the order of your images on each video:

☒ Randomize on Each Video

Important: Use Small Images.

We recommend you to use images with a file size below 1 Megabyte.

If you use Big images, your generated videos will be also big (no matter if you use a video compressor or not), and the generation process may take a lot of time.

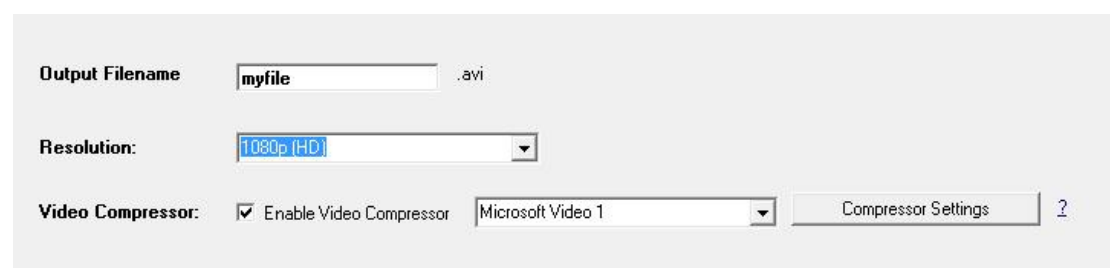

**Tip: If you need to compress your images in bulk,
we recommend you to use the following software (free):**

<http://icompressor.blogspot.com.ar/2016/10/introduction-to-hassle-free-image.html>

Step 3: Make Your Videos!

From the “Make Videos” tab you’re ready to create your video.

Just enter a name for your video, your desired resolution and a video compressor.

The screenshot shows a web interface for creating videos. It has three main sections: 'Output Filename' with a text input field containing 'myfile' and a '.avi' extension; 'Resolution' with a dropdown menu showing '1080p (HD)'; and 'Video Compressor' with a checked checkbox 'Enable Video Compressor', a dropdown menu showing 'Microsoft Video 1', a 'Compressor Settings' button, and a help icon.

What is a compressor? A compressor it’s like an “external program” that helps you to reduce the size of your video. Some compressors deliver good results, some not. We recommend “Microsoft Video” but if you have a better one, feel free to go ahead with it).

After this, press the “Make Videos” button and your videos will be ready within some minutes.

That’s all!

(Space intentionally left in blank)

Final Comments and Troubleshooting

Text to Speech:

Always test a voice before creating a video (select a voice and click the test button).

Troubleshooting: Some Voices May Not Be Available...

Some voices may Not work with the system and this is Ok...but...if none of the installed voices work, then you have a problem with the SAPI voices module:

Option 1: You don't have the SAPI module installed or...

Option 2: Your SAPI version is too old.

Both options are very rare if you have a modern version of Windows (7, 8 or Higher) but if you're experiencing this (no voice is installed or no voice is working), please look for the latest SAPI version on Microsoft.com

Here's a Link that may help:

<https://www.microsoft.com/en-us/download/details.aspx?id=10121>

Video Compressors:

Video compressors (codecs), help you to reduce the size of your videos. We strongly recommend you to use one.

Comments:

- Our software uses the codecs that you already have.
- Not all the codecs produce good results. If you have the "Microsoft Video" codec, we recommend you to use that one, but of course, you're free to use any other.
- If you want to produce smaller videos, you can also use a lower resolution.

General Issues:

Q: The videos take too long to be created. What can i do?

A: Create a video without a compressor. If everything works ok without a compressor, then you need to pick another compresor.

We strongly recommend you to make a test video with a compressor. Once that everything goes ok, go on with a real project.

Situation: Videos have no images (i hear the voice but i can't see the images).

Please open the .avi file with another video player to make sure that the issue is not with the player or missing codec for avi.

A player that may help us VLC. In case that you don't have it you can freely download it from this url:

<https://www.videolan.org/vlc/>

We also recommend you to download a codec pack like "K-Lite", to update your Codecs. You can get this pack from this url:

https://www.codecguide.com/download_kl.htm

If you still can't see it, please create a quick video without compressors (tab 3).

Situation: When i create a video i get an "Error 5".

Is the software installed under "c:\manyvideospro" (not under system folders like "c:\program files\manyvidspro")?

Please check this as the software needs to work under that folder (i was able to replicate the same error when i've moved it to a system folder).

You can fix this in 2 ways:

- Option 1: Go to the folder where the app is currently installed and locate ManyVidsPro.exe.

Then make a right click on it and select "Run as Administrator" (if this option is available).

- Option 2: Uninstall the program from your control panel. After this, install it again making sure that it installs under "c:\manyvidspr".
